Tiers security summary (20/6/26)

Tier 1:

From now, the security consists of:

- Creating a dedicated user with dedicated permissions that can only LOG in via SSH to the machine using public keys
- Enabling firewall and allow SSH
- Installing tailscale to create a virtual network that is only accessible via tailscale users on a specific tailscale account
- Instruct the agent on how to behave: what it can and cannot do
- Encrypt credential storage and add an openclaw service with the encrypted credential that starts on boot

```
From now on, if you want to securily access openclaw
1 - Access it from its dedicated user via ssh
ssh openclaw@ip_address or tailscale ssh (to be seen)

2- Start tailscale service
tailscale up

3- Openclaw has already started at boot with
systemctl status openclaw-secure
If you want to verify it
Make sure you are the openclaw user, otherwise switch to it
openclaw status

4- Link them
sudo tailscale serve --bg --yes 18789

https://[device_name].tail[xxxxx].ts.net
```

```
5- To connect your windows machine
Turn on tailscale so it can be on the same network
```
